

Web of Science: A Guide to Searching the Database

Web of Science provides access to three major citation indexes: Science Citation Index, Social Sciences Citation Index, and Arts and Humanities Citation Index. These databases bring together indexing for over 8,000 scholarly journals. It includes approximately 15,250 new cited references and 2,250 new articles per week. Access Web of Science by going to “Find Articles” on the library homepage, then clicking **Databases A-Z**.

General Search

Use the general search form to search by topic keyword, author, journal title, etc. Use the dropdown box to choose the field you’d like to search.

Here’s a hint—Use the Search History link to combine several previous searches. This is a great way to get very specific results.

Cited Reference Search

Web of Science allows users to search for all of the articles cited as research in a specific article. For example, the search below will look for any articles that used the article by Rose in the Journal of Psychosocial Oncology as a reference. This type of searching is useful in finding additional resources on your topic or finding the latest research in a specific area.

TIP: Easily narrow down your hits by searching within the results for an additional topic. For example, adding “women” to the search will eliminate any records not dealing with *women* cancer survivors.

Working with the Results

From the Search Results Summary page, click the hyperlinked article title to get more information on the article, including an abstract (a summary of the article) and a link to cited references. Use the “Links” or “View Full Text” buttons to view the full text of the article when available.

Clicking on **Create Citation Report** will show you a chart describing how many times all items have been cited and the number of times an article has been cited each year.

Linking To More Sources

When viewing the full record for an article there are several ways to find additional sources related to your topic. The **References** link will produce all of the articles cited as research in the article shown. Clicking the **Times Cited** link will bring up all of the articles in which the article shown was used as a reference.

Related Records will find articles that share citations with the parent article. The database works on the assumption that the more cited references two articles share, the closer this subject relationship is.

ADVANCED BREAST-CANCER AND ITS PREVENTION BY SCREENING

Abstract: In discussions on breast cancer screening, much attention has been focussed on the possible morbidity generated by screening. Favourable effects like the prevention of advanced disease seem underestimated, probably because quantification is that difficult. To analyse the amount of care and treatment given to women with advanced breast cancer, we report on patients followed from first recurrence until death using patient files and national sources. A random sample of 60 female cases from computerised registries of two cancer centres and a sample of 20 cases from a non-computerised hospital registry was taken. A total of 68 patient files were sufficiently documented. A woman with advanced breast cancer is estimated to have a 39% loss in utility compared to a healthy woman (range 27-45%). Hormonal treatment is the main modality during 14 and chemotherapy during 4 months. Total medical cost from diagnosis of advanced disease until death amounts to 17,100 US dollars, or 21,000 when including extramural cost.

The effect of breast cancer screening by preventing the occurrence of advanced disease is quantified. The resulting gain in quality of life contributes 70% of the total gain in quality of life. In the long run, almost half of the annual cost of screening will be offset by savings in the cost for advanced disease. Only the changes in palliative surgery and/or radiotherapy will be small in contrast to primary treatment changes. Besides the mortality reduction, screening is justified by the improvements in quality of life and cost savings for women prevented from reaching advanced disease.
